

<b>Purpose</b> 	<p>To demonstrate the <i>effect that height has on the energy</i> of a moving object.</p> <p><i>Will rolling a marble from a higher starting place make it strike the cup harder?</i></p>
<b>Hypothesis</b> 	<p><input type="radio"/> I think the marble rolled from <i>pencil height</i> will strike the cup harder.</p> <p><input type="radio"/> I think the marble rolled from <i>book height</i> will strike the cup harder.</p>
<b>Materials</b> 	<ul style="list-style-type: none"> <li>● scissors</li> <li>● 8-ounce paper cup</li> <li>● ruler with a center groove</li> <li>● pencil</li> <li>● marble</li> <li>● book</li> </ul>
<b>Procedure</b> 	<ol style="list-style-type: none"> <li>1. Cut a 1 1/2 inch square section from the top of the paper cup.</li> <li>2. Place the cup over the ruler. The end of the ruler should touch the back edge of the cup.</li> <li>3. Raise the opposite end of the ruler &amp; rest it on the pencil.</li> <li>4. Place the marble in the center groove of the ruler at the ruler's highest end.</li> <li>5. Release the marble &amp; observe the cup.</li> <li>6. Raise the end of the ruler &amp; rest it on the edge of the book.</li> <li>7. Again, position the marble in the groove at the ruler's highest end. Release &amp; observe.</li> </ol>
<b>Results</b> 	<p>The  moved the most when hit by the  that rolled from the <i>height</i> of the:</p> <p> or </p> <p>Circle One</p>
<b>Conclusion</b> 	<p>Objects at rest have <i>potential energy</i>. The higher the object sits above the ground, the greater its potential energy.</p> <p>When objects fall or roll down an incline, their <i>potential energy</i> changes into <i>kinetic energy</i>--energy of motion.</p> <p>Increasing the height from which the marble rolled gave it more energy, causing it to strike the cup with more force. Therefore, the cup moved further.</p>

<b>Purpose</b> 	<p>To demonstrate that an object remains <i>stationary</i> due to <i>inertia</i></p> <p><i>What will happen when I yank the paper out from underneath the can?</i></p>
<b>Hypothesis</b> 	<p>When I quickly remove the piece of paper from under the can, it will:</p> <div style="border: 1px solid red; padding: 5px;"> <p><input type="radio"/> I think the can will explode!</p> <p><input type="radio"/> I think the can will not move.</p> <p><input type="radio"/> I think the can will fall over.</p> </div> 
<b>Materials</b> 	<ul style="list-style-type: none"> <li>•scissors</li> <li>•ruler</li> <li>•typing paper</li> <li>•unopened can of soda</li> </ul>
<b>Procedure</b> 	<ol style="list-style-type: none"> <li>1. Cut a 4 inch x 10 inch strip of paper</li> <li>2. Lay the paper strip on a clean, dry table.</li> <li>3. Place the soda can over one end of the paper. Be sure the bottom of the can is clean &amp; dry.</li> <li>4. Hold the other end of the paper &amp; push it close to the can.</li> <li>5. Quickly snap the paper away from the can in a straight line.</li> </ol>
<b>Results</b> 	<p><input type="radio"/> The can <i>DID NOT</i> move when I pulled the paper out from underneath it.</p> <p><input type="radio"/> The can <i>DID</i> move when I pulled the paper out from underneath it.</p> <p><i>If the paper was pulled out quickly enough, the can should have remained upright &amp; in the same place.</i></p> 
<b>Conclusion</b> 	<p><i>Inertia</i> is a resistance to any change in motion.</p> <p>An object that is stationary remains that way until some force causes it to move.</p> <p>The can is not attached to the paper. Because of the can's inertia, it remains stationary even though the paper moves forward.</p>
